

The bottom navigation pill, end to end.

Every tab on every bar, what it lands on, what is on that screen, and where each thing goes next — for all three life stages, both partner views, and the doctor app. Written so a review can be done without opening the app and flipping four toggles to see all seven.

7	32	3	1
DISTINCT BARS	TAB ENTRIES	NAVIGATION MECHANICS	SHARED COMPONENT

Source of truth the repo, not a design file. Every claim names its file.

Component `lib/widgets/pv_nav_bar.dart` — PvNavBar, and the three thin adapters over it

Generated by `tools/nav_map.py` — regenerate rather than edit the HTML

Companions docs/APP-FLOW-MAP.pdf (the whole app) · docs/FLOW-INVENTORY.md (what to design next)

Seven bars, and the rules they all obey

Pregnancy – mother	Today · Prepare · Tools · Calendar · Community
Pregnancy – father (Dad mode)	Today · Journey · Reads · Read · Journal
Trying to Conceive – V1	Today · Prepare · Tools · Calendar · Community
Trying to Conceive – V3	Today · Courses · Tools · Talk to expert · More
Trying to Conceive – the partner (Him)	Today · Prepare / Tools / Calendar / Community
Parenting (post-pregnancy)	My Child · Brain · Tools · Community · Products
ParentVeda+ – the doctor app	Home · Appointments · Availability · Impact · Profile
Appendix – the Explore drawer	One tap from parenting tab 0, and larger than most tabs
What to look at	Seven things a reviewer should decide on

THE RULES PVNAVBAR ENFORCES

The app had **three** bottom bars and each had been fixed once, by a different pass, so each had a different half of the same fix. A component on every screen of every stage cannot be three components. They now delegate to one, and differ only in their tabs and their accent.

Nothing moves when you switch tabs. Every tab is icon-above-label, always, active or not. Two of the three bars used to turn the active tab into a horizontal pill, so selecting a tab re-flowed the row and the other four labels slid sideways. The transition is now a colour crossfade and nothing else — there is no geometry left to animate.

No container behind the active tab. Not because Material 3's pill is bad design, but for two reasons of our own: our labels are always visible, so the label already says which tab she is on and colour says it again — a container is a redundant third signal. And **action** is the only saturated colour this app spends; a filled violet shape parked on every screen at all times spends that meaning down to nothing.

The inactive label must be readable. It was **neutral400** — 2.73:1 against the app ground, when WCAG AA asks 4.5:1. The most-seen text in the entire app was at well under half the required contrast. It is **neutral1600** now: 5.28:1.

Two changes mark the active tab — colour *and* weight. Never one alone.

Labels never hide, never wrap, never go below 11px. And every tab is **Expanded**, so the row shares its width evenly and cannot overflow however large the user's text scale is. A five-tab bar that overflows at 1.3× is a crash for exactly the person who set it.

The bar floats on a tinted shadow. Distinct from the page without a hard border.

Pregnancy — mother

Every mother-account user. The default shell of the app.

0 Today	1 Prepare	2 Tools	3 Calendar	4 Community
------------	--------------	------------	---------------	----------------

HOW A TAP MOVES YOU

An **IndexedStack**. All five pages are built once and stay alive; a tap changes `AppNav.instance.index` and nothing is pushed or popped. So scroll position, form state and controllers survive tab switches, the hardware back button does *not* step between tabs, and there is no "back to Today" — Today is always underneath. A tap also records one `UsageEvents.screen()`, keyed by position rather than by label so a language switch cannot split one surface into two.

Built in `lib/screens/main_scaffold.dart` → `PvTabBar` → `PvNavBar`

Today

TodayHomeScreen (wrapper)

lib/screens/today_home_screen.dart · route — (IndexedStack slot 0)

A wrapper, not a screen. It decides which of three Todays is on screen — **Classic** (the shipped home, `home_screen_b.dart`), **Focus**, or **V3** — from a session-only `TodayVersionStore` that always starts on Classic. The Classic | V3 pill floats top-right on the page itself.

WHAT IS ON IT

Brand header — Mark + wordmark, then three round icons: **Saved hub**, **global search**, and the **avatar**. There is no Profile tab in this design — the avatar is the only way to Profile.

Three stage doorways — Parenting (pushes route `pp/my_child`), Trying-to-Conceive (pushes `ttc/today`), and Skilling (preview, UI only). These are how you leave this bottom bar for another one.

Weekly Snapshot — The hero: week, day, a one-line brief for the week, trimester progress, and “View week >”.

Today’s parenting tip — GrowModule — the featured editorial read of the day.

Today’s Journey — The daily stack: Today’s Video, Daily Garbh Sanskar, My Journal, medication & supplements, Daily Reads, and a product carousel.

Commerce, at the foot — Launch Spotlight and the invite nudge. Both render nothing when nothing is live, which is most mornings.

WHERE IT GOES FROM HERE

> Avatar	ProfileScreen — language, journal, Dear Baby, products, the stage switch
> Bookmark icon	SavedHubScreen
> Search icon	Global search sheet
> Parenting doorway	PpHomeScreen (route <code>pp/my_child</code>) — swaps you onto the parenting bar
> TTC doorway	TtcHomeScreen (route <code>ttc/today</code>) — swaps you onto the TTC bar
> Skilling doorway	SkillingPreviewScreen — twelve doors, none of them live
> “View week >”	WeeklyCardStackScreen
> Today’s Video	The video player
> Garbh card	GarbhScreen — the four live pillars
> Journal card	JournalScreen
> Medication card	MedicineTrackerScreen

The version pill is testing chrome and is session-only on purpose — an experiment that persists is a release.

1 Prepare PrepareHubScreen

lib/screens/prepare/prepare_hub_screen.dart · route — (IndexedStack slot 1)

The paid / guided layer. A hero, a recommended rail of two programmes, then exactly four category rows.

WHAT IS ON IT

Recommended rail — Two featured programmes from the unified catalogue — a masterclass and a cohort — each opening ProgramDetailScreen.

Courses & Cohorts — The unified V2 screen. Masterclasses and cohort programmes were folded in here; their old standalone tiles are commented out.

Birthing Classes — Kept as-is.

Yoga — Opens the *same* cult.fit-style screen the parenting side uses, filtered to pregnancy categories. One UI, two tabs.

Nutrition — A funnel: assessment → plans → trailer → consult → plan.

Sponsorship strip — PresentedBy — renders only when live sessions are sponsored. A brand funds the room; it does not choose the answers.

WHERE IT GOES FROM HERE

› Courses & Cohorts	CoursesCohortsScreen → ProgramDetailScreen → booking
› Birthing Classes	BirthingClassesScreen
› Yoga	YogaHomeScreen (shared with parenting)
› Nutrition	NutritionScreen
› Any programme card	ProgramDetailScreen → the shared booking engine (lib/booking/)

2 Tools ToolsHubScreen

lib/screens/tools_hub_screen.dart · route — (IndexedStack slot 2)

The toolbox. A Journey Map hero, a progressive-profiling strip, then a two-column grid of roughly twenty tiles, re-ordered live by what she said she wants help with.

WHAT IS ON IT

Journey Map hero — Full-width gradient card → JourneyMapScreen.

Priorities strip — Progressive profiling, asked exactly where the answer pays off: her pick re-sorts the grid immediately below.

The grid — A **stable sort that returns every tile** — tools matching a chosen priority move to the front, nothing is hidden or removed. Level-3 personalisation: content and order, never structure.

Support note — A closing reassurance panel.

WHERE IT GOES FROM HERE

3 Calendar CalendarScreen

lib/screens/calendar_screen.dart · route – (IndexedStack slot 3)

The command centre. A progress card, category filter chips, search, and a three-way segmented control. **It opens on tab 1, the grid – not the timeline.**

WHAT IS ON IT

Progress card – Where she is, quietly.

Filter chips – One choke point feeding all three views. ParentVeda's own recommendations are excluded from every one of them.

Timeline (seg 0) – Everything that has happened and is coming, as a rail.

Calendar grid (seg 1, default) – Month grid with coloured day markers and a collapsible legend. Tapping a date scrolls to that day's detail panel.

Upcoming (seg 2) – Milestones, appointments, tests and scans only.

Day sheet – Opened from a day. Carries the day's events and up to three actions.

WHERE IT GOES FROM HERE

› Day sheet → “Open week”	Selects that week, then WeeklyCardStackScreen
› Day sheet → “Open journal”	JournalScreen
› Day sheet → Delete	Only on a personal, non-system event
› Add event	A bottom sheet with mic dictation

4 Community CommunityScreen

lib/screens/community_screen.dart · route — (IndexedStack slot 4)

The social layer over the shared `CommunityStore`. Utility icons scroll with the page rather than sitting in a bar.

WHAT IS ON IT

Utility row — Doctor test-mode toggle · bookmarks · my activity · search.

Your communities — Rooms she has joined. **Always renders** — an empty state, never a missing section.

Recommended communities — Rooms she has not joined. Same rule.

Feed tabs — For you / Following, then the feed.

Experts-only chip — Narrows the feed to posts by verified experts. Available to every viewer.

Verify-triage chip — Doctor mode only — posts awaiting endorsement.

Compose FAB — Floats clear of the pill via a lifted end-float location.

WHERE IT GOES FROM HERE

› A community card	CommunityDetailScreen
› A post	Post detail — comments, related discussions, suggested communities
› Bookmark icon	MyBookmarksScreen
› Person icon	MyActivityScreen
› Search icon	A search delegate over rooms and posts
› An expert name	CommunityProfileScreen

Pregnancy — father (Dad mode)

A paired father, and any mother previewing him with the testing Mom I Dad pill (bottom-right, Today tab, Classic only).

0 Today	1 Journey	2 Reads	3 Read	4 Journal
------------	--------------	------------	-----------	--------------

HOW A TAP MOVES YOU

The same shell, the same `IndexedStack`, the same five slots. Only the pages, the labels and the accent change — Slate instead of violet. Tabs 0 and 1 (Today, Journey) are shared ideas rendered in his voice; tabs 2–4 become his own sections.

`FatherPreview.instance.on` is the single switch, set in `initState` for a paired father.

Built in `lib/screens/main_scaffold.dart` — same `PvTabBar`, `father: true`

0 Today FatherDailyScreen (embedded)

`lib/screens/father/father_daily_screen.dart` · route — (slot 0)

His daily space, in the Slate palette — “grounded, warm, getting ready to meet my baby”. Its own palette, not `AppTheme`.

WHAT IS ON IT

Daily cards — His day, with the scans & appointments due-now card below the read-to-baby block.

1 Journey WeeklyCardStackScreen

`lib/screens/weekly_card_stack_screen.dart` · route — (slot 1)

The same weekly card stack the mother gets: seven swipeable cards for the active week, a week strip with future weeks locked.

Switching to this tab snaps the stack to the *current* week — `_onNav` calls `selectWeek(currentWeek)` on every change to slot 1.

2 Reads FatherReadsScreen

`lib/screens/father/father_reads_screen.dart` · route — (slot 2)

His library, grouped as Articles · Research Summaries · Book Summaries.

WHERE IT GOES FROM HERE

> Any read

The Slate “Learn V2” reader — progress bar, table of contents, font size, reading modes, Why-This-Matters / Research-Simplified / Myth-vs-Fact blocks

3 **Read** `FatherReadAloudScreen`

`lib/screens/father/father_read_aloud_screen.dart` · route — (slot 3)

Read to baby. The same four tabs as the mother's Samvad: Affirmations & Blessings · Stories & Fables · Mantras & Lullabies · Spiritual Reading.

He **cannot customise**. Spiritual Reading mirrors whatever the mother chose, read-only. Only Affirmations & Blessings draws from a distinct father slice.

4 **Journal** `FatherJournalScreen` (embedded)

`lib/screens/father/father_journal_screen.dart` · route — (slot 4)

A deliberately smaller cousin of My Journal: four quick actions and a newest-first feed.

WHAT IS ON IT

Quick actions — Write a memory · Note for baby · Add photo · Record voice.

Stores into a **separate** `FatherJournalStore`, but reuses the mother's compose sheets through their `onAdd` hook.

Trying to Conceive — V1

Anyone in the TTC stage with the home version left on V1. The version pill lives in TTC Profile.

HOW A TAP MOVES YOU

Not an IndexedStack — a **pop-then-push**. `openTtcTab` runs `popUntil(isFirst || name == "ttc/today")` and then pushes the target as a named route. So Today is always at the bottom of the stack, every other tab is one route above it, and hardware-back from any tab returns to Today. Each tab screen is rebuilt on entry — nothing is kept warm.

Built in `lib/screens/ttc/ttc_common.dart` → `TtcBottomNav` → `PvNavBar`, floated by `TtcPage`

0 Today `TtcTodayScreen` (via `TtcHomeScreen`)

`lib/screens/ttc/ttc_today_screen.dart` · route `ttc/today`

The stage home. `TtcHomeScreen` is the gate in front of it: it holds the first-run intro flow and the V1/V3 switch, and a paired partner is diverted here to `TtcPartnerTodayScreen` instead.

WHAT IS ON IT

TtcHeader — Mark + wordmark, and the avatar → TTC Profile. On every TTC screen.

Chapter hero — The chapter name in Fraunces, its tagline, a “day N of M” line, a days-trying chip, an ⓘ that explains the chapter, and “Journey map >”.

Rhythm card — Where she is in the cycle.

Today’s Journey — One insight **card** (the only real article), then four **rows** — the myth, today’s nutrition, today’s movement, today’s pick. Rows because a row is a line you scan and a card is a small article you have to read.

Ritual card — Keeps its card: per-item checkboxes, a count and a streak. You *do* this from Today rather than opening a screen.

Journal card — Four shortcut circles.

Record a test — The one door out of the stage. Understated, never a prompt.

Disclaimer — Every tool carries it, so the busiest screen does too.

WHERE IT GOES FROM HERE

> Avatar	<code>TtcProfileScreen</code> — language, sign-out, the V1/V3 pill, the HerlHim pill
> Chapter ⓘ	A sheet: what the chapter means, what moves you on, worth doing
> “Journey map >”	<code>TtcJourneyMapScreen</code> (<code>ttc/map</code>)
> Insight card	<code>TtcInsightScreen</code>
> The four rows	Each opens the same content in a sheet
> Ritual card	<code>TtcRitualScreen</code>
> Journal card	<code>TtcJournalScreen</code>
> Record a test	The positive-test flow → the pregnancy shell

1 Prepare TtcPrepareScreen

lib/screens/ttc/ttc_prepare_screen.dart · route ttc/prepare

The commerce surface, unfiltered: **all nine categories** with their offerings, running on the shared booking engine.

WHAT IS ON IT

The nine categories — Expert consultations · Courses · Fertility yoga · Nutrition · Mental wellness · Medical assessments · Partner workshops · IVF support · Lifestyle programmes.

Offering cards — Title, price, body, a “for both of you” chip where it is a couple offering, session count, and “owned” once an entitlement exists.

Payment note — Says on screen that payment is stubbed.

WHERE IT GOES FROM HERE

› **Any offering** Detail → buy (grants the entitlement) → slot picking → My Bookings, the same history a birthing class lands in eight months later

2 Tools TtcToolsScreen

lib/screens/ttc/ttc_tools_screen.dart · route ttc/tools

Twenty-two tiles in four groups. The hub is the **index**; a journey step is the recommendation. Both must exist — a woman told she might have PCOS opens Tools and searches for the word.

WHAT IS ON IT

Your body — Cycle Companion · Ovulation Companion · Fertility Window · Symptom Companion · Weight · Sleep · PCOS symptom check · Weight and fertility (BMI) · See a specialist?

Both of you — Partner Health · Mood · Stress · Lifestyle · Journal.

Care and medicines — Supplements · Medication · Medical Tests · Vaccinations · Records & reports · Appointments.

Plan and learn — Movement · Nutrition Planner · Journey Map · Can I...? · Pre-pregnancy checklist · Worth knowing about.

WHERE IT GOES FROM HERE

› Cycle Companion	TtcCycleScreen (ttc/cycle)
› Fertility Window	TtcFertilityWindowScreen (ttc/window)
› Symptom / Weight / Sleep / Mood / Stress / Lifestyle / Movement / Partner Health	The shared tracker screen, opened on that metric
› PCOS symptom check	The PCOS surface
› Weight and fertility	TtcBmiScreen — deliberately <i>not</i> the Weight tracker beside it: one logs a series, the other reads one number against South Asian cut-offs
› Supplements / Medication / Tests / Vaccinations / Records / Appointments	Their own screens; several show a live count under the tile
› Journey Map	TtcJourneyMapScreen
› Can I...?	TtcCanIScreen
› Pre-pregnancy checklist	TtcPrecheckScreen
› Worth knowing about	TtcProductsScreen — research first, buy second

3 Calendar TtcCalendarScreen

`lib/screens/ttc/ttc_calendar_screen.dart · route ttc/calendar`

The TTC command centre. Same architecture as the pregnancy calendar: a month grid with coloured markers, a collapsible legend, and a panel for the selected day.

WHAT IS ON IT

The day panel — Merges the cycle, the fertile window, journal entries, everything logged in the trackers, and milestones reached.

Expected period — Drawn as a **soft outline, labelled “expected”** — never a solid marker on a day her body has not agreed to.

The fertile window comes from the same engine as Today's hero and the Fertility Window tool, so the three cannot disagree.

4 Community TtcCommunityScreen

`lib/screens/ttc/ttc_community_screen.dart · route ttc/community`

The shared social layer again — `CommunityStore` keyed by id, so a room joined here is still joined in the parenting feed two years later.

WHAT IS ON IT

Loss & Recovery room — A product that only holds hope is not honest about this stage.

Ordering — Rooms by what the couple joined; the feed chronological within that. Nothing here is ranked by popularity.

WHERE IT GOES FROM HERE

› **Care circle** TtcCareCircleScreen

Trying to Conceive — V3

Anyone whose `TtcHomeVersionStore` is on V3. This is the design the stage is moving to; V1 is the revert path, not the other arm of a live experiment.

0 Today	1 Courses	2 Tools	3 Talk to expert	4 More
------------	--------------	------------	---------------------	-----------

HOW A TAP MOVES YOU

Same pop-then-push over `ttc/today`. Two things are different and both have bitten before:

1. The tab set is chosen by the store, not by the caller. `TtcBottomNav.v3` used to be a `bool` defaulting to false, and only two screens passed it — so every screen reached through `TtcPage` drew V1's five tabs under a V3 app. It is nullable now, and null means "ask the store". *A default that is wrong for most callers is not a default, it is a trap.*

2. The active index is translated by route name. `TtcPage(tab: 3)` means Calendar in V1 and "Talk to expert" in V3, so reusing the index would highlight a tab the screen has nothing to do with. `ttcV3ActiveFor` maps the route; anything unrecognised lands on **More**, which is the truth rather than a fallback.

Built in `same TtcBottomNav, v3 resolved from the store`

0 Today TtcHomeV3

lib/screens/ttc/ttc_home_v3.dart · route ttc/today

A photographic hero field the page slides over, then a sheet of sections. The big fact is **where she is**, never a probability, never a countdown, and never a “chapter N of 5” — chapters 2–4 come round with every cycle.

WHAT IS ON IT

Cycle header — Replaced the chapter hero. Leads on the week and the window, with the chapter as a chip above them. Carries avatar, date strip and a calendar icon.

My daily insights — Titled with the **selected date**, not the word “Today” — a heading saying “Today” over cards computed for last Tuesday is a screen lying about its own contents.

Start anywhere — The bracket door grid, four columns, one per TTC bracket.

Garbhadhana Samskara — The pre-conception practice — the ritual card in full, with checkboxes and a streak. **Not** Garbh Sanskar, which is the pregnancy feature and a different thing.

Recommended for you — A product rail. Shows category and price, never a benefit — a supplement rail on a fertility home is one careless subtitle away from being a claim.

Recommended reads — The chapter card, then Me / Us / What’s next tabs hung off it, then a rail into the reads library.

Your journal — Pregnancy’s widget verbatim, with four quick actions.

Talk to experts — The section that **ends** the page — deliberately not the products rail. The last thing she reads is that there is a person, not a price.

The door out — The positive-test door, plus the disclaimer.

WHERE IT GOES FROM HERE

› Avatar	TtcProfileScreen
› Chapter chip	TtcJourneyMapScreen
› Cycle-day line	The cycle companion (<code>ttc_cycle</code>)
› Calendar icon	TtcCalendarScreen
› A door in the grid	That bracket’s problem hub / journey
› Chapter card	The chapter reader, default tab
› Me / Us / What’s next	The chapter reader on that tab — the card alone could only reach “Me”
› Read rail	PvReaderScreen for that piece
› Journal quick actions	Journal · Journal · Calendar · Partner
› “Fertility experts”	TtcPrepareScreen, unscoped

1 Courses TtcPrepareScreen(onlyCategory: "courses")

lib/screens/ttc/ttc_prepare_screen.dart · route ttc/courses

Prepare, scoped to one category.

Scoping is the fix, not a limitation. Unscoped, Courses and Talk-to-expert opened the identical nine-category screen and both labels lied about where they went.

2 Tools TtcToolsScreen

`lib/screens/ttc/ttc_tools_screen.dart · route ttc/tools`

Identical to V1's Tools — same twenty-two tiles, same four groups.

Tabs 0 and 2 keep V1's icons deliberately: Today and Tools mean the same thing in both versions, so flipping the pill should not make her re-find them.

3 Talk to expert TtcPrepareScreen(onlyCategory: "consults")

`lib/screens/ttc/ttc_prepare_screen.dart · route ttc/consults`

Prepare, scoped to expert consultations.

WHERE IT GOES FROM HERE

› **An offering** Buy → the calendar case of the booking engine → a real slot

4 More TtcMoreScreen

`lib/screens/ttc/ttc_more_screen.dart · route ttc/more`

Not a junk drawer — the other half of a deliberate trade. V3 dropped two tabs and narrowed a third, and the trade only holds if this screen is complete.

WHAT IS ON IT

Your cycle — Calendar · Cycle companion · Fertility window.

Community — Community · My journal · Profile.

Prepare — One row into the **unfiltered** nine-category Prepare screen.

WHERE IT GOES FROM HERE

› Calendar	TtcCalendarScreen
› Cycle companion	the cycle surface
› Fertility window	TtcFertilityWindowScreen
› Community	TtcCommunityScreen
› My journal	TtcJournalScreen
› Profile	TtcProfileScreen
› Everything else	TtcPrepareScreen, all nine categories

⚠ The seven Prepare categories without a tab — yoga, nutrition, mental wellness, assessments, partner workshops, IVF support, lifestyle — are reachable through **this one row and nowhere else**. Scoping it would delete six of them. Caught by asking “where did yoga go?”, not by a test.

The parity test (`ttc_home_v3_parity_test`) covers the two *homes*, not the nav. This screen is what keeps V3 complete.

Trying to Conceive — the partner (Him)

A paired partner, and anyone flipping the dev-only Her I Him pill in TTC Profile.

0
Today

1
Prepare / Tools / Calendar / Community

HOW A TAP MOVES YOU

The same five destinations, his colours. Deliberately not a reduced tab set: per-user navigation is forbidden — personalisation changes content, ranking and order, never structure — and the pregnancy father shell follows the same rule. One scaffold, his content inside it. The stage branches at `TtcTodayScreen` rather than at the doorway, so both halves of the couple share one route and one back-stack.

Built in `same TtcBottomNav, slate: true`

0 Today `TtcPartnerTodayScreen`

`lib/screens/ttc/ttc_partner_screen.dart · route ttc/today`

Structurally identical to hers — same card shell, same gutter — in Slate.

WHAT IS ON IT

Section order — mission → supporting her → your half of this → learn → journal. Not hers with the labels swapped: "your half of this" sits above the reading and the journal on purpose. A partner screen where his own body appears last has quietly decided this is her project.

The partner door **never sends** `cycle_day` to Ask Veda.

His header gained the profile door late — before that a paired partner had no way to switch language and no way to sign out, on any screen. One header with a palette flag, rather than two headers; two headers is how it went missing.

1 Prepare / Tools / Calendar / Community `the same four screens`

Unchanged destinations in the Slate palette.

Parenting (post-pregnancy)

Reached through the parenting doorway on the pregnancy Today, or by the stage switch.

0 My Child	1 Brain	2 Tools	3 Community	4 Products
---------------	------------	------------	----------------	---------------

HOW A TAP MOVES YOU

Pop-then-push, like TTC: `openPpTab` does `popUntil(isFirst || name == "pp/my_child")` then pushes. Tab 0 is the `popUntil` — nothing is pushed, you simply arrive back at the home however deep you were. The bar is positioned inside each page's Stack rather than by a shell, so every tab screen mounts its own `PpBottomNav(active: n)`.

Built in `lib/screens/post_pregnancy/pp_common.dart` → `PpBottomNav` → `PvNavBar`

My Child

PpHomeScreen → MyChildScreen(home: true) or PpHomeV3

lib/screens/post_pregnancy/my_child_screen.dart · route pp/my_child

The parenting home, built around the child's current developmental **leap**. `PpHomeVersionStore` chooses between the shipped screen (V1, the default) and PpHomeV3.

WHAT IS ON IT

Header — Mark + wordmark, then **bookmark**, **search**, **profile** and the **hamburger** — which opens the Explore drawer, the largest single destination in the app (see overleaf).

Leap hero — Photo, name, age, the phase number/name/tagline and the storm → sun leap progress. The photo and name open the child switcher.

Leap video — Comes from the phase's Watch category, so there is no "this phase has no video" case.

Leap description — Expandable.

Child snapshot — The domain rows.

Journal — The keepsake journal's door.

Watch & Learn rails — Videos then reads for the leap.

Products for this phase — Mixed across the leap's milestones and domains.

FAQs — Top three questions for the age, rotating on each app open.

Looking ahead — One line about the next leap.

Brand slots — Premiere on open (rarely), Launch Spotlight, invite nudge — each renders nothing unless something is genuinely live.

WHERE IT GOES FROM HERE

› Hamburger	ExploreDrawer — ~25 sections; the full list is its own page below
› Bookmark	PpSavedHubScreen
› Search	RecoSearchScreen
› Profile	FamilyProfileScreen
› Photo / name	MultiChildSheet — the child switcher
› Leap hero	LeapDefinitionScreen
› Phase block	PhaseDetailScreen / PhaseMapScreen
› A snapshot domain row	DevelopmentAreaScreen → DevStageDetailScreen
› Journal	JournalHomeScreen (V2 storybook)
› A video	WatchPlayerScreen · a rail header → WatchCategoryScreen
› A read	ReadingReaderScreen · a collection → ReadingCollectionScreen
› A product	RecoDetailScreen
› "Ask Veda anything else"	The parenting Ask Veda — this and the FAB are its only doors now , since it lost its tab

1 Brain GrowHomeScreen

`lib/screens/post_pregnancy/grow_home_screen.dart`

A wrapper over **three** versions of the same feature, chosen by a floating pill: V1 is `DevelopmentHomeScreen` constructed exactly as Explore used to construct it, plus `GrowV2Home` and `GrowV3Home`.

WHAT IS ON IT

V1 — Development home — Today's Focus · the birth-to-five Development Map · the eight development areas, each its own journey · today's activities (filtered by the child's age, falling back to the full list rather than showing nothing) · a Brain Development window · Looking Ahead · a gentle check-in.

WHERE IT GOES FROM HERE

> Today's Focus	<code>DevelopmentActivityScreen</code>
> Development Map	<code>DevelopmentMapScreen</code>
> An area	<code>DevelopmentAreaScreen</code>
> "See all activities"	<code>DevelopmentAllActivitiesScreen</code>
> Check-in	<code>DevelopmentCheckinScreen</code>

This tab used to be Ask Veda. The parenting review took Ask Veda out of the bar and moved Skill Development in, renamed "Brain". Ask Veda is not gone — it is on the My Child page and on the Ask FAB — but it no longer has a permanent slot. The old line is kept commented in `openPpTab`.

"Brain" rather than "Brain Development": five tabs share the width evenly and a two-word label truncates on a small phone. The screen is titled in full.

⚠ Three versions behind one row is a design question deferred to a runtime switch — logged in `STILL-OPEN.md` §5.9.

2 Tools ToolsHubScreen (parenting)

lib/screens/post_pregnancy/tools_hub_screen.dart

An editorial header and one list of everyday trackers with live status lines.

WHAT IS ON IT

Everyday trackers — What Changed? · Growth journey · Product Guide · Vaccination schedule · Baby names · Feeding journey · Sleep journey.

WHERE IT GOES FROM HERE

› What Changed?	WhatChangedScreen — a searchable 30-concern library
› Growth journey	GrowthJourneyScreen
› Product Guide	ProductGuideHubScreen — Compare now lives inside it , as a row at the top: you compare while choosing, not from a toolbox two taps away
› Vaccination schedule	VaxTrackerScreen — the redesign; the old VaccinationScreen is kept for revert
› Baby names	BabyNamingHomeScreen — the V1IV2 front door
› Feeding journey	FeedingJourneyScreen
› Sleep journey	SleepJourneyScreen

Four rows were deliberately removed and are commented in place: His Leap Window (the leap already leads the home), Development journey (already in the hero and the milestone section), Launches and Brand Studio (moved to Explore — Tools is for what you use *on* your child), and Compare (moved into the Product Guide). *A third door to the same place made Tools look like it was padding.*

3 Community CommunityScreen (parenting)

lib/screens/post_pregnancy/community_screen.dart

A faithful parenting replica of the pre-birth community on the **same** CommunityStore and models — only the content differs.

WHAT IS ON IT

Same structure — Your communities · Recommended communities · a For-you / Following pill · post cards with polls, photos, like/comment/repost/save/share · post detail with comments, related and suggested · a full composer · doctor test-mode, “needs verification” triage and endorse-by-commenting · my activity · my bookmarks · a search delegate.

The pregnancy feed is untouched: every list here is computed from parenting data plus the store's per-id state.

4 Products ProductsDiscoveryScreen

lib/screens/post_pregnancy/products_discovery_screen.dart

“Research first. Buy when you’re sure.” A search bar, a marketplace-style Filters + Sort bar, and four discovery entry points.

WHAT IS ON IT

Four entry points — Concern · Age-stage · Category · Compare.

Filters — A **button** opening a full sheet, not inline toggles — plus brand, price band, rating band and sort.

Two modes — With no filter set it shows the browse-by-category list; once anything is set it becomes a ranked results grid.

WHERE IT GOES FROM HERE

> A category	ProductsCategoryScreen → ProductsSubcategoryScreen
> “Compare any two”	ProductsCompareScreen
> A product	ProductDetailScreen

ParentVeda+ — the doctor app

Shown by the app root instead of MainScaffold whenever `DoctorSession.active` is true. A separate app that happens to live in the same binary.

0 Home	1 Appointments	2 Availability	3 Impact	4 Profile
-----------	-------------------	-------------------	-------------	--------------

HOW A TAP MOVES YOU

⚠️ **This is the one bar that is not the pill.** It is a hairline-topped white `bottomNavigationBar`, 62pt, with filled/outlined icon pairs — not `PvNavBar`, not floating, not rounded. It switches with a plain `setState` over five bodies, so like pregnancy there is no push and no back between tabs. It is deliberately calm and clinical: a work tool, not the warm parent experience.

The shell also keeps the roster fresh three ways — on app resume, on a 90-second poll (for the phone left open on a desk, which never resumes because it never left), and by pull-to-refresh. Prescriptions ride along, because every screen decides what to say about a past consult from `PrescriptionStore.hasFor()`.

Built in `lib/screens/doctor/doctor_scaffold.dart` — **its own bar**

0 Home `DoctorHomeScreen`

`lib/screens/doctor/doctor_home_screen.dart`

The dashboard: who they are, the calls waiting today, the sessions they run, and a way into availability.

1 Appointments `DoctorAppointmentsScreen`

`lib/screens/doctor/doctor_appointments_screen.dart`

The practice in one list, in the three buckets a clinic day actually has.

WHAT IS ON IT

Today — What is happening now, in order, with Join.

Upcoming — Everything after today.

Past — Done — and what still needs a prescription written.

2 Availability `DoctorScheduleScreen`

`lib/screens/doctor/doctor_schedule_screen.dart`

One screen for the ordinary case, progressive disclosure for the exceptions. A doctor whose week is “Mon–Sat, morning and evening clinic” is done in under a minute and never sees a per-day editor.

Replaced a 7×6 grid of six hardcoded times, in which a doctor working 10:30–13:00 could not describe their own day.

3 **Impact** `DoctorImpactTab`

`lib/screens/doctor/doctor_impact_tab.dart`

The Partner Journey Dashboard, with Earnings **inside** it rather than beside it.

The ordering is the point: a doctor opening this tab sees how many families they have helped, and has to *choose* to look at the money. The two sets of numbers are deliberately not merged.

4 **Profile** `DoctorProfileScreen`

`lib/screens/doctor/doctor_profile_screen.dart`

What the doctor manages about themselves, and the way out of doctor mode back to the parent app.

The Explore drawer

Not a tab, but reachable in one tap from the hamburger on parenting tab 0 — and larger than any tab on any bar. It is where the parenting stage keeps everything that does not fit five hero slots, and it is the reason the parenting bar can be five tabs wide without losing features. Any review of “what can I reach from the pill” has to include it.

Personalize ParentVeda experience	FamilyProfileScreen	Tune what you see, for your family.
Watch	WatchHomeScreen	Expert videos, chosen for his stage.
Health	HealthHomeScreen	The living health companion — vaccination folded in as a summary.
Recipes	RecipesExploreScreen	Curated by age — browse by meal, not by filter.
Recommendations	RecoExploreScreen	Expert-curated books, toys, activities.
Read	ReadExploreScreen	Vetted reads, by topic and by type.
Courses & Masterclasses	CoursesExploreScreen	Expert-led, vetted for your stage.
Yoga & Classes	YogaHomeScreen	Live & recorded, every stage.
My Bookings	MyBookingsScreen	Classes and sessions, one place.
Invite a friend	InviteFriendsScreen	You both get a free consultation.
Your Care Circle	CareCircleScreen	The people supporting you.
Memories	MemoriesHomeScreen	Cards for the moments that matter.
Find help	ProblemSolverScreen	Vetted local services.
Dadi/Nani Nuskhe	NuskheScreen	Home remedies, safely.
Investments & Savings	InvestmentsScreen	Plan ahead.
Astrology & Numerology	AstrologyScreen	Optional cosmic notes.
My Journal V2	JournalWelcomeScreen	A keepsake storybook.
Launches	LaunchHubScreen	The Launch Hub's one parenting front door.
Brand Studio	BrandShowcaseScreen	All 15 brand products, walked end to end.
Skilling (preview)	SkillingPreviewScreen	The fourth stage — UI only, nothing behind the doors.
Brand Studio (debug)	BrandPreviewScreen	Debug builds only.

Rows commented out rather than deleted, per the repo rule: My Child (it is the home now), Guided journeys, His journey, Skill Development (promoted to the **Brain** tab), Health Guide, Food, the old Recipes and Recommendations screens, Masterclasses, Cohort Courses, Guides & Tools, Courses. Each is one uncommented line from coming back.

What a review should decide on

Everything above is what the app does. This page is judgement — the seven things worth an argument, written so they can be agreed or dismissed rather than rediscovered.

HIGH

The same five words mean two different things

“Prepare” in pregnancy is four category rows: Courses & Cohorts, Birthing Classes, Yoga, Nutrition. “Prepare” in TTC V1 is nine categories of paid offerings. “Tools” in pregnancy is a 20-tile grid sorted by stated priorities; “Tools” in TTC is 22 tiles in four named groups; “Tools” in parenting is seven tracker rows. A woman crossing TTC → pregnancy → parenting meets the same five labels three times and has to relearn what is behind two of them. Worth deciding whether that is intended.

HIGH

Three different navigation mechanics under one visual component

Pregnancy is an IndexedStack (state survives, back does not step between tabs). TTC and parenting are pop-then-push (state is rebuilt every entry, back always returns to tab 0). The doctor app is a setState over five bodies in a completely different bar. The pill *looks* identical in the first three, so the difference is invisible until something depends on it — a half-typed post, a scroll position, an in-progress log.

MEDIUM

Ask Veda has no permanent home on the parenting side

It lost its tab to Brain Development and now lives on the My Child page and the floating FAB. The FAB is present, so nothing is unreachable — but the stage that most invites a question is the one where asking is not on the bar.

HIGH

Every V3 nav change costs an entrance somewhere

V3 dropped Calendar and Community and split Prepare; `TtcMoreScreen` is the entire compensation, and seven Prepare categories hang off **one row** in it. The parity test covers the two homes, not the bars. If a tab is ever added to V3, whatever it displaces needs an entrance before the change lands — that is the direction that breaks.

MEDIUM

Eight version toggles, four of them reachable from a bottom tab

Today (ClassicIFocusIV3), PP Home (CurrentIV3), TTC Home (V1IV3), Grow (V1IV2IV3) — plus Health Wallet, Scans Hub, Shravan and Baby Naming deeper in. Each is a design question deferred to a runtime switch, and none of them is actually answered: the user still gets whichever we defaulted to. See [docs/FLOW-INVENTORY.md](#).

LOW

Testing chrome is still on the bar’s doorstep

The Mom I Dad pill floats bottom-right on pregnancy Today (Classic only), the Classic I V3 pill floats top-right, and the doctor-mode toggle sits in the community utility row. All three ship in release builds today. They are listed here so the pre-launch sweep has a list.

Nothing floats at a hardcoded offset any more — check new work against that

Every floating control used to sit at `bottom: 96`, which cleared the bar on a gesture-nav phone and was swallowed by it on a three-button one. `pvNavClearance()` is the answer, and it reads `viewPadding` rather than `padding` because an ancestor `SafeArea` collapses the latter to zero. Anything new in the bottom strip should use it. (The MomlDad pill is a deliberate exception — it was never the control that got swallowed.)
